

FINANCIAL PERFORMANCE REPORT

SO- FRESH

Sales & Profitability Analysis

The Business Challenge

- So Fresh operates across 5 regions with 10 product lines and no consolidated view of financial performance
- Sales and expense data existed in silos with no way to measure actual results against budget targets
- Which products, regions, and managers drove or undermined overall profitability, and by how much?

Executive KPI Summary

Total Revenue

¥3.12M

23% above the budget

Expense Variance

¥149k

Below budget — favorable

Net Profit

¥2.45M

+42.5% above budget

Net Margin

78.7%

Overall portfolio margin

Revenue, Expenses, and Profit all finished ahead of plan simultaneously.

Revenue & Expense Performance by Month

May was the peak revenue month at 45% above budget

November delivered the highest savings at 33.7% below budget

Sales Performance

REVENUE

- Banana 38.9% and Orange 33.5% are the star products, leading on both revenue variance and margin.
- Apple and Pineapple are the weakest products at 13.5% above sales budget, nearly 3 times behind Banana.
- May delivered 45% above budget, making it the highest sales month of the year.

Cost Control

Expenses

- Business underspent by ~~₦149k~~ overall, a favorable result across all 5 branches
- Musa Garba in Kaduna achieved the largest expense underspend at ~~₦35,300~~
- Despite a favorable monthly budget variance, June suffered 4 localized product-branch net losses, exposing severe operational bottlenecks

Monthly Profitability Trend

Monthly Net Profit variance & Net Profit Margin

- Best margin was in May at 83.8%
- Worst margin was in September and December at 76.2%

NET MARGIN DISTRIBUTION

PERFORMANCE

- Lagos runs the highest net profit margin at **80.4%**, making it the most efficient branch.
- Pineapple and Cucumber appear across the branches in loss-making combinations each making them the highest risk products
- The Warri branch operates at an 87.3% margin when selling Pawpaw, but plummets to a 68.5% margin when selling Apples. This 18.8 pt gap proves that Warri's local supply chain is highly unstable and completely unstandardized

Problem Products

Product		Sum of Actual Net	Count of Prod
+ Pineapple	-#	3,127	4
+ Cucumber	-#	4,095	4
+ Melon	-#	1,546	3
+ Pawpaw	-#	1,237	2
+ Avocado	-#	1,368	1
+ Mango	-#	82	1
Grand Total	-#	11,456	15

15

Total loss
instances

4

June loss
instances

Pineapple and Cucumber are losing money in specific branches despite hitting sales targets

RECOMMENDATIONS

1

Scale Banana & Orange

Both products consistently leads on sales variance net profit variance, and net margin. Increase sales volume targets and allocate more marketing budget to these crops across all regions.

2

Freeze Pineapple & Cucumber in Loss Branches

Pineapple and Cucumber account for 8 of 15 loss instances. Suspend expansion in the specific branches where losses occur until a product-level cost audit is completed.

3

Restructure Warri's Apple Supply Chain

The problem is not the branch, it is the Apple supply chain specifically. Redirect Warri's Apple allocation toward Pawpaw until a cost audit identifies the root cause.

4

Standardize Pawpaw Operations to Warri Model.

Map Warri's exact cost structure for Pawpaw and standardize their operating procedures across all other branches...

5

Build a June and July Expense Buffer

These two months account for 7 of 15 total loss instances. Model the historical overspend in both months and build a specific expense buffer into Q2 and Q3 of the next budget cycle.

6

Add COGS Data Before Next Cycle

Separate product cost from operational cost; the current expense metric blends everything into one number. Without Cost of Goods Sold, the analysis cannot distinguish a production cost problem from an operating expense problem..

CONCLUSION

The business is profitable.

The distribution beneath it needs attention.

+42.5%

Net profit above plan

Revenue growth and cost control aligned perfectly to beat targets

18.8pts

Margin gap, best vs worst

Pawpaw (87.3%) vs. Apple (68.5%) within Warri alone. High-level averages are hiding localized supply chain failures.

15

Silent loss combinations

Pineapple and Cucumber losing money in specific branches while the headline number looks healthy.

Mandate the separation of products costs from operational expenses so we can fix the execution gap.
